Cognitive Psychology & Learning Science — Page 1

1. Human Memory Systems (Atkinson-Shiffrin Model)

Human memory is organized into three distinct operational stores: Sensory Memory (holds raw visual and auditory impressions for fractions of a second), Working Memory (holds 4 to 7 informational chunks for 15 to 30 seconds), and Long-Term Memory (virtually limitless repository for consolidated knowledge).

2. The Ebbinghaus Forgetting Curve

Hermann Ebbinghaus discovered that newly acquired theoretical information degrades exponentially over time without deliberate review. Up to 70% of unreviewed material is lost within the initial 24 to 48 hours following exposure.

3. Active Recall & Evidence-Based Pedagogy

Active Recall refers to the pedagogical practice of deliberately stimulating memory retrieval without looking at original study notes. Effortful retrieval testing dramatically enhances neural synaptic consolidation.

4. Spaced Repetition and the Leitner System

The Spaced Repetition technique schedules review sessions at expanding time intervals. The Leitner Box System organizes flashcards into progressive tiers from Box 1 (daily) to Box 5 (mastered monthly). Incorrect answers reset the card to Box 1.
